

Fall 2012 Lab Assignment 7

You are to implement a class that uses generics.

You have been given a driver class. This creates instances of a `MyApplication` class that uses a pair of `Basket` data types in one case and `Integer` data types in another. The `MyApplication` class implements a method called `operation` that swaps these two instances, so that after the `operation` method is called, the two data instances have been swapped.
